University of Trento, Fondazione Bruno Kessler

Planning problem

## Planning Problem

## Planning Problem

Given $\langle I, G, T\rangle$, where

- I: (representation of) initial state
- G: (representation of) goal state
- T: transition relation
find a sequence of transitions $t_{1}, \ldots, t_{n}$ leading from the initial state to the goal state.

## Idea

Encode planning problem as a model checking problem, such that plan is provided as counter-example for the property.

1. impose $\mathbf{I}$ as initial state
2. encode $\mathbf{T}$ as transition relation system
3. verify the LTL property! (F goal_state)

## Example: blocks [1/9]

INIIIAL
GUAL

T
Init :
$\operatorname{On}(A, B), \operatorname{On}(B, C), O n(C, T), C l e a r(A)$
Goal :
On $(C, B), O n(B, A), O n(A, T)$
Move $(a, b, c)$
Precond: $\operatorname{Block}(a) \wedge \operatorname{Clear}(a) \wedge O n(a, b) \wedge$
$($ Clear $(c) \vee \operatorname{Table}(c)) \wedge$
$a \neq b \wedge a \neq c \wedge b \neq c$
Effect: $\quad \operatorname{Clear}(b) \wedge \neg \operatorname{On}(a, b) \wedge$
On $(a, c) \wedge \neg$ Clear $(c)$

## Example: blocks [2/9]

```
MODULE block(id, ab, bl)
VAR
    above : {none, a, b, c}; -- the block above this one
    below : {none, a, b, c}; -- the block below this one
DEFINE
    clear := (above = none);
INIT
    above = ab &
    below = bl
-- a block can't be above or below itself
INVAR below != id & above != id
```

MODULE main
VAR
-- at each step only one block moves
move : \{move_a, move_b, move_c\};
block_a : block(a, none, b);
block_b : block(b, a, c);
block_c : block(c, b, none);

## Example: blocks [3/9]

- a block cannot move if it has some other block above itself

TRANS
(!block_a.clear -> move != move_a) \&
(!block_b.clear -> move != move_b) \&
(!block_c.clear -> move != move_c)

## Example: blocks [3/9]

- a block cannot move if it has some other block above itself

TRANS
(!block_a.clear $->$ move ! = move_a) \&
(!block_b.clear -> move ! = move_b) \&
(!block_c.clear -> move != move_c)

- Q: what's wrong with following formulation?

TRANS
(block_a.clear -> move = move_a) \&
(block_b.clear $->$ move $=$ move_b) \&
(block_c.clear -> move = move_c)

## Example: blocks [3/9]

- a block cannot move if it has some other block above itself

TRANS
(!block_a.clear -> move != move_a) \&
(!block_b.clear -> move != move_b) \&
(!block_c.clear -> move != move_c)
...

- Q: what's wrong with following formulation?

TRANS
(block_a.clear -> move = move_a) \&
(block_b.clear -> move = move_b) \&
(block_c.clear -> move = move_c)
A:

- move can only have one valid value $\Longrightarrow$ inconsistency whenever there are two clear blocks at the same time
- any non-clear block would still be able to move
- same for "iff" formulation

## Example: blocks [4/9]

- a moving block changes location and remains clear TRANS

```
(move = move_a -> next(block_a.clear) &
    next(block_a.below) != block_a.below) &
(move = move_b -> next(block_b.clear) &
    next(block_b.below) != block_b.below) &
(move = move_c -> next(block_c.clear) &
    next(block_c.below) != block_c.below)
```

- a non-moving block does not change its location TRANS

```
(move != move_a -> next (block_a.below) = block_a.below) &
(move != move_b -> next (block__b.below) = block_b.below) &
(move != move_c -> next(block_c.below) = block_c.below)
```

## Example: blocks [5/9]

- a block remains connected to any non-moving block TRANS

```
(move ! = move_a \& block_b.above = a
    -> next (block_b.above) = a) \&
    (move ! = move_a \& block_c.above = a
        -> next (block_c.above) = a) \&
(move != move_b \& block_a.above = b
    -> next (block_a.above) = b) \&
    (move ! = move_b \& block_c.above = b
    -> next (block_c.above) = b) \&
    (move != move_c \& block_a.above = c
    -> next (block_a.above) = c) \&
    (move ! = move_c \& block_b.above = c
    -> next (block_b.above) = c)
```

## Example: blocks [5/9]

- a block remains connected to any non-moving block TRANS

```
(move ! = move_a \& block_b.above = a
    -> next (block_b.above) = a) \&
    (move != move_a \& block_c.above = a
        -> next (block_c.above) = a) \&
    (move != move_b \& block_a.above = b
        -> next (block_a.above) = b) \&
    (move != move_b \& block_c.above = b
        -> next (block_c.above) = b) \&
    (move != move_c \& block_a.above = c
    -> next (block_a.above) = c) \&
    (move ! = move_c \& block_b.above = c
    -> next (block_b.above) = c)
```

- Q: what about "below block"?

## Example: blocks [5/9]

- a block remains connected to any non-moving block TRANS

```
(move ! = move_a \& block_b.above = a
    -> next (block_b.above) = a) \&
    (move != move_a \& block_c.above = a
        -> next (block_c.above) = a) \&
    (move != move_b \& block_a.above = b
        -> next (block_a.above) = b) \&
    (move != move_b \& block_c.above = b
        -> next (block_c.above) = b) \&
    (move != move_c \& block_a.above = c
    -> next (block_a.above) = c) \&
    (move ! = move_c \& block_b.above = c
    -> next (block_b.above) = c)
```

- Q: what about "below block"?

A: covered in previous slide!

## Example: blocks [6/9]

- positioning of blocks is symmetric: above and below relations must be symmetric.

```
INVAR
    (block_a.above = b <-> block_b.below = a)
& (block_a.above = c <-> block_c.below = a)
& (block_b.above = a <-> block_a.below = b)
& (block_b.above = c <-> block_c.below = b)
& (block_c.above = a <-> block_a.below = c)
& (block_c.above = b <-> block_b.below = c)
& (block_a.above = none ->
    (block_b.below != a & block_c.below != a))
& (block_b.above = none ->
    (block_a.below != b & block_c.below != b))
& (block_c.above = none ->
    (block_a.below != c & block_b.below != c))
& (block_a.below = none ->
    (block_b.above != a & block_c.above != a))
& (block_b.below = none ->
    (block_a.above != b & block_c.above != b))
& (block_c.below = none ->
    (block_a.above != c & block_b.above != c))
```

## Example: blocks [7/9]

## Remark

A plan is a sequence of transitions/actions leading from the initial state to an accepting/goal state.

## Idea

- assert property $p$ : "goal state is not reachable"
- if a plan exists, NUXMV produces a counterexample for $p$
- the counterexample for $p$ is a plan to reach the goal

## Example: blocks [8/9]

## Examples

- get a plan for reaching "goal state" SPEC

$$
\begin{aligned}
\text { !EF (block_a.below } & =\text { none \& block_a.above }=\mathrm{b} \text { \& } \\
\text { block_b.below } & =\mathrm{a} \& \mathrm{block} \text { _b.above }=\mathrm{c} \& \\
\text { block_c.below } & =\mathrm{b} \text { \& block_c.above }=\text { none) }
\end{aligned}
$$

## Example: blocks [8/9]

## Examples

- get a plan for reaching "goal state"

SPEC

```
    !EF(block_a.below = none & block_a.above = b &
        block_b.below = a & block_b.above = c &
        block_c.below = b & block_c.above = none)
```

- get a plan for reaching a configuration in which all blocks are placed on the table

## SPEC

!EF (block_a.below = none \& block_b.below = none \& block_c.below $=$ none)

## Example: blocks [9/9]

- at any given time, at least one block is placed on the table INVARSPEC
block_a.below = none | block_b.below = none | block_c.below = none

## Example: blocks [9/9]

- at any given time, at least one block is placed on the table InVARSPEC
block_a.below = none | block_b.below = none |
block_c.below = none
- at any given time, at least one block has nothing above INVARSPEC
block_a.above = none | block_b.above = none |
block_c.above = none

## Example: blocks [9/9]

- at any given time, at least one block is placed on the table

```
INVARSPEC
block_a.below = none | block_b.below = none |
block_c.below = none
```

- at any given time, at least one block has nothing above INVARSPEC
block_a.above = none | block_b.above = none |
block_c.above = none
- we can always reach a configuration in which all nodes are placed on the table

## SPEC

```
AG EF (block_a.below = none & block_b.below = none &
    block_c.below = none)
```

## Example: blocks [9/9]

- at any given time, at least one block is placed on the table INVARSPEC

```
block_a.below = none | block_b.below = none |
block_c.below = none
```

- at any given time, at least one block has nothing above INVARSPEC

```
block_a.above = none | block_b.above = none |
block_c.above = none
```

- we can always reach a configuration in which all nodes are placed on the table

## SPEC

```
AG EF (block_a.below = none & block_b.below = none &
    block_c.below = none)
```

- we can always reach the goal state

SPEC

```
    AG EF(block_a.below = none & block_a.above = b &
        block_b.below = a & block_b.above = c &
        block_c.below = b & block_c.above = none)
```

## Examples

## Example: tower of hanoi [1/4]

Game with 3 poles and $N$ disks of different sizes:

- initial state: stack of disks with decreasing size on pole $A$
- goal state: move stack on pole $C$
- rules:
- only one disk may be moved at each transition
- only the upper disk can be moved

- a disk can not be placed on top of a smaller disk

## Example: tower of hanoi [2/4]

- base system model

```
MODULE main
VAR
    d1 : {left,middle,right}; -- largest
    d2 : {left,middle,right};
    d3 : {left,middle,right};
    d4 : {left,middle,right}; -- smallest
    move : 1..4; -- possible moves
```

## Example: tower of hanoi [2/4]

- base system model

```
MODULE main
VAR
d1 : {left,middle,right}; -- largest
d2 : {left,middle,right};
d3 : {left,middle,right};
d4 : {left,middle,right}; -- smallest
move : 1..4; -- possible moves
```

- disk $i$ is moving

DEFINE

```
move_d1 := (move = 1);
move_d2 := (move = 2);
move_d3 := (move = 3);
move_d4 := (move = 4);
```

## Example: tower of hanoi [2/4]

- base system model

```
MODULE main
VAR
d1 : {left,middle,right}; -- largest
d2 : {left,middle,right};
d3 : {left,middle,right};
d4 : {left,middle,right}; -- smallest
move : 1..4; -- possible moves
```

- disk $i$ is moving

DEFINE

```
move_d1 := (move = 1);
move_d2 := (move = 2);
move_d3 := (move = 3);
move_d4 := (move = 4);
```

- disk $d_{i}$ can move iff $\forall j>i . d_{i} \neq d_{j}$

```
clear_d1 := (d1!=d2 & d1!=d3 & d1!=d4);
clear_d2 := (d2!=d3 & d2!=d4);
clear_d3 := (d3!=d4);
clear_d4 := TRUE;
```

## Example: tower of hanoi [3/4]

- initial state

INIT
d1 = left \&
d2 = left \&
d3 $=$ left \&
d4 = left;

## Example: tower of hanoi [3/4]

    wolf = right
    man = right
```

## Example: tic-tac-toe [1/5]

Tic-tac-toe is a turn-based game for two adversarial players ( X and O) marking the squares of a board ( $\rightarrow$ a $3 \times 3$ grid). The player who succeeds in placing three respective marks in a horizontal, vertical or diagonal row wins the game.

- Example: O wins

- we model tic-tac-toe puzzle as an array of size nine

## Example: tic-tac-toe [2/5]

- base system model

```
MODULE main
VAR
    B : array 1..9 of {0,1,2};
    player : 1..2;
    move : 0..9;
```

## Example: tic-tac-toe [2/5]

- base system model

```
MODULE main
VAR
B : array 1..9 of {0,1,2};
player : 1..2;
move : 0..9;
```

- initial state

```
INIT
    B[1] = 0 &
    B[2] = 0 &
    B[3] = 0 &
    B[4] = 0 &
    B[5] = 0 &
    B[6] = 0 &
    B[7] = 0 &
    B[8] = 0 &
    B[9] = 0;
INIT
move = 0;
```

## Example: tic-tac-toe [3/5]

- turns modeling

```
ASSIGN
    init(player) := 1;
    next(player) :=
    case
        player = 1 : 2;
        player = 2 : 1;
    esac;
```

## Example: tic-tac-toe [3/5]

- turns modeling

```
ASSIGN
    init(player) := 1;
    next(player) :=
    case
        player = 1 : 2;
        player = 2 : 1;
    esac;
```

- move modeling

TRANS

```
next (move=1) ->
    B[1] = 0 & next(B[1]) = player &
    next (B[2])=B[2] &
    next (B[3])=B[3] &
    next (B[4])=B[4] &
    next (B[5])=B[5] &
    next (B[6])=B[6] &
    next (B[7])=B[7] &
    next (B[8])=B[8] &
    next (B [9]) =B [9]
```

## Example: tic-tac-toe [4/5]

- "end" state

DEFINE

$$
\begin{aligned}
& \text { win1 }:=(B[1]=1 \& B[2]=1 \& B[3]=1) \quad(B[4]=1 \& B[5]=1 \& B[6]=1) \\

\end{aligned}
$$

TRANS
(win1 | win2 | draw) <-> next(move) $=0$

## Example: tic-tac-toe [5/5]

A strategy is a plan that need to be accomplished for winning the game "if the opponent has two in a row, play the third to block them"

- player 2 does not have a "winning" strategy SPEC
! ( $\operatorname{Ax}$ ( $\operatorname{EX}$ ( $\operatorname{AX}$ ( $\operatorname{Ex}(\operatorname{AX}(E X \quad(A X \quad(E X ~(A X ~ w i n 2))))))))$
- player 2 has a "non-losing" strategy

SPEC
AX (EX (AX (EX (AX (EX (AX (EX (AX !win1)))))))

## Verification:

```
nuXmv > read_model -i tictactoe.smv
nuXmv > go
nuXmv > check_ctlspec
-- specification !(AX (EX (AX (EX (AX (EX
    (AX (EX (AX win2))))))))) is true
-- specification AX (EX (AX (EX (AX (EX
    (AX (EX (AX !win1)))))))) is true
```

## Exercises

## Exercises [1/4]

## Tower of Hanoi

Extend the tower of hanoi to handle five disks, and check that the goal state is reachable.

## Exercises [2/4]

## Ferryman

Another ferryman has to bring a fox, a chicken, a caterpillar and a crop of lettuce safely across a river.

- initial state: all goods are on the right side
- goal state: all goods are on the left side
- rules:
- the ferryman can cross the river with at most two passengers on his boat
- the fox eats the chicken if left unattended on the same side of the river
- the chicken eats the caterpillar if left unattended on the same side of the river
- the caterpillar eats the lettuce if left unattended on the same side of the river

Can the ferryman bring every item safely on the other side?

## Exercises [3/4]

## Tic-Tac-Toe

encode and verify the following properties

- player 2 has also a "non-winning" strategy
- player 2 does not have a "losing" strategy
- player 2 does not have a "drawing" strategy
- player 2 has a "non-drawing" strategy
- player 1 does not have a "winning" strategy
- player 1 has a "non-losing" strategy
- player 1 has also a "non-winning" strategy
- player 1 does not have a "losing" strategy
- player 1 does not have a "drawing" strategy
- player 1 has a "non-drawing" strategy

## Exercises [4/4]

## Sudoku

Encode in an SMV model the game of Sudoku, write a property so that nuXmV finds the solution.
You can find the rules on Wikipedia.

## Tip

Use a MODULE to avoid repetitions of the same constraints. 220 lines are enough.
